

Sensum

PRO ULTRATHIN

BRAIDS

Long tests of casting, sealing and duration involved the Nomura testimonials before presenting and marketing this multifibre dedicated to the Ultra-Light Game, the Trout Area and Eging. We used the best Japanese technology that allows the union of very thin filaments of polyethylene through a hot melting process to create a product with a round, steady and with very thin diameters. The technical features that come from this new product, completely satisfy the needs of every fan: capacity without equal in relation to the diameter, softness that allows it to run light and silent between the guides transporting the lures at a great distance, rigidity that allows you to understand how the bait is working inside the water, high resistance to abrasion. It is presented in a translucent white color, perfect even in conditions of low visibility.

The ultimate expression of Japanese technology can be found in this new braid with nine strands of pure Polyethylene, unique in its kind. Dedicated to fishing with lures, especially for medium-light spinning. Thanks to the special nine-wire processing with silicone surface coating, this innovative braid is perfectly round, soft and flexible, allowing longer and more accurate casting. In particular, the roundness of the section allows the braid to cut water 47% faster than an eight-strand braid. In addition, the fibers cooperate unequivocally with each other offering a greater breaking strength and a higher abrasion resistance of (20% more compared with an eight-strand braid). It is available in the Moss Green color, ideal for most situations.

INVISIBLE

目に見えない
最新世代の技術 // 水中に目に見えない!

All the best Japanese technology and know-how has been put together to create this INVISIBLE line construction. Low memory factor, incredibly smooth, no refraction in the water, superior knot strength and abrasion resistance make this ultraclear fluorocarbon perfect for all those hard to catch species.

Being invisible, it goes undetected by fish, it will never give away the presence of the fisherman. The wide range of diameters can fit the needs of many different fishing styles also can be used to tie high resistance leaders.

YUKAI 誘揚

2 COLOURS SHOCK LINE

CAMOUFLAGE EFFECT

The Freshwater PRO TEAM NOMURA developed this new camou line specifically for pike fishing and fishing for other big predators. Thanks to the greenish-brown color of the monofilaments this line is the perfect solution for hunting those hard to catch species. Low memory, exceptionally strong, with the perfect combination of smoothness and low stretch, making every lure easy to cast and allowing the anglers to remain easily in contact with the bait. Available in 150 m spools from diameters 0.20 to 0.30.

The Japanese word "otoshi" means "snare". This florescent master series is perfect for those modern anglers that require hi-performance monofilaments for spinning. Otoshi is just the right mix of versality and hi-quality with no compromises. This monofilament maintains an excellent handling and castability while reduces the memory factor thanks its particular internal construction combined with the outer silicon coating. It is therefore completely waterproof, with this special silicon treatment insulating the structure of the line from the exterior, maintaining all its technical characteristics even after prolonged use. Our Nomura anglers developed this monofilaments in two series: Otoshi Yellow in 150 yds (135 mtrs) spools and Otoshi Orange in 165 yds (150 mtrs) spools; Yellow is available from diameter 0.14 to 0.28 and Orange from 0.14 to 0.35.
